Halloween Project 1

This is the first lab for a website we will build on in subsequent labs, so it is important that you keep up!

1. View index.html in a browser and then open main.css in the styles folder for editing.
2. Add your name to the top in a comment.
3. For the body element, set a font-family of at least two sans-serif fonts followed by the generic **sans-serif** at the end. (You can see installed fonts in Windows by using the search tool for "installed fonts".)
4. For the anchor element, set the **font-weight** to bold and the **color** to orange.
5. Add style rules to format the links so they're displayed in boldfaced orange whether or not they've been visited. If a link has the focus or the mouse is hovering over it, though, it should be displayed in green. (Hint: use the pseudo classes :link and :visited :hover and :focus.)
6. For elements inside the header element apply the following styles:
   a. Float the image in the header to the left
   b. Indent both headings 25px using text-indent
7. In addition, change the color of the first heading to orange, italicize it, and add a black shadow.
8. Use the pseudo-selector **:first-letter** to format the first letter of the first heading in the main content so it's larger than the other letters in the heading.
9. Format the list to increase the space between the list items.
10. Format the body of the page so it's 800 pixels wide, has a white background, has a black border with a shadow, and is centered in the browser window.
11. Add a background image behind the body of the page that uses the bats.gif file in the images folder. This image should repeat both horizontally and vertically.
12. Add a black border below the header and above the footer.
13. Adjust the margins and padding for the elements on the page to your liking.
